

RCP02 V13 Release Notes

These notes cover changes made to the RCP02 code since release V12 of 21 August 1998. If you are upgrading from an earlier release, please read those notes also.

Bug Repairs

None

New Features

1. The support for intermediate minor releases of RCP02 code has been improved. The RCP02 now has a major version number (the one that it always had), plus a minor version number for intermediate "unofficial" releases. The minor number starts from zero at the time of each "official" release, and then increments until the next "official" release. The RCP02 front panel and TTY startup messages will show the minor release number (if it is not zero). Likewise, the minor release number of the code that last saved the nonvolatile RAM will be shown in the "Help View" command. Previously, one had to rely on checking the date of the code to determine which minor release was being used.

The "official" Rev.13 release is therefore an exact copy of Rev.12, except that minor revision support has been added. Upcoming minor releases will be numbered "13.1", "13.2", etc., eventually leading up to Rev.14.

Setup Changes

None
