

IRIS 7.22 Release Notes

These notes cover changes made in IRIS since release 7.21 of 12 October 2000. If you are upgrading from an earlier release, please read those notes also.

Documentation Changes

1. The *IRIS Installation Manual* now documents the new X-based **install** program. Please use this to install IRIS, and be sure to use a version 7.22 or later copy of the manual. There is an important mistake in the 7.22 instructions: You must always execute **install** in the current working directory. In other words, please “cd” to the correct cdrom directory before running **install**.

Bug Repairs

1. Fixed a bug in the antenna driver introduced with the time setting repair in 7.21 which caused most of the status and control bits in **antenna** to be disabled.

New Features

1. Added a new question to the DSP section of **setup** to control whether the Byte Order tests are performed whenever the DSP is powered up. This is to support models of signal processors which do not support this feature.
