

IRIS 7.24 Release Notes

These notes cover changes made in IRIS since release 7.23 of 16 Feb 2001. If you are upgrading from an earlier release, please read those notes also.

Installation Changes

1. The **instiris** script will now first delete the old contents of your `${IRIS_ROOT}/install` directory. This will remove old programs, like **install_iris**, when upgrading. Remember to not execute out of this directory if you are doing a local installation.

Bug Repairs

1. *SGI Platforms Only:* Fixed a problem with the data alignment of the subcatchment inventory. This caused the CATCH product to fail on SGI only.
2. Fixed the pop-ups for display of data from individual raingages from the GAGE product. This has never worked correctly.

New Features

1. Changed the `acroread` script file to correctly determine viewer directory based on the `IRIS_BIN_ACROBAT` environment variable. This saves an extra installation step when upgrading or installing on systems where the `IRIS_ROOT` is not set to `"/usr/sigmet"`.
2. IRIS now supports a new data type called "Time", generally displayed in minutes. This is used in the upcoming DWELL product, and can be configured in **color_setup**.
